NOCICEPTIN RECEPTOR ORL-1 AGONISTS FOR USE IN TREATING COUGH

10 BACKGROUND

The nociceptin receptor ORL-1 has been shown to be involved with modulation of pain in animal models. ORL-1 (the nociceptin receptor) was discovered as an "orphan opioid-like receptor" i.e. a receptor whose ligand was unknown. The nociceptin receptor is a G protein coupled receptor. While highly related in structure to the three classical opioid receptors, i.e. the targets for traditional opioid analgesics, it is not activated by endogenous opioids. Similarly, endogenous opioids fail to activate the nociceptin receptor. Like the classical opioid receptors, the nociceptin receptor has a broad distribution in the central nervous system.

In late 1995, nociceptin, also known as Orphanin FQ (OFQ), was discovered and shown to be an endogenous peptide ligand that activates the nociceptin receptor. Data included in the initial publications suggested that nociceptin and its receptor are part of a newly discovered pathway involved in the perception of painful stimuli. Subsequent work from a number of laboratories has shown that nociceptin, when administered intraspinally to rodents, is an analgesic. The efficacy of nociceptin is similar to that of endogenous opioid peptides. Recent data has shown that nociceptin acts as an anxiolytic when administered directly into the brain of rodents. When tested in standard animals models of anxiety, the efficacy of nociceptin is similar to that seen with classical benzodiazapine anxiolytics. These data suggest that a small molecule agonist of the nociceptin receptor could have significant analgesic or anxiolytic activity.

Additional recent data (Rizzi, et al, <u>Life Sci.</u>, <u>64</u>, (1999), p. 157-163) has shown that the activation of nociceptin receptors in isolated

10

15

20

30

guinea pig bronchus inhibits tachykinergic, non-adrenergi, non-cholinergic contractions, indicating that nociceptin receptor agonists could be useful in the treatment of asthma. Also, it has been reported (Ciccocioppo et al, Physchopharmacology, 141 (1999), p. 220-224) nociceptin reduces the rewarding properties of ethanol in msP alcohol preferring rats, suggesting that intervention of nociceptin could be useful in the treatment of alcohol abuse. In EP 856,514, 8-substituted 1,3,8-triazaspiro[4,5]decan-4-on derivatives were disclosed as agonists and/or antagonists of orphanin FQ (i.e., nociceptin) useful in the treatment of various disorders, including depression; 2-oxoimidazole derivatives disclosed in WO98/54168 were described as having similar utility. Earlier, benzimidazolyl piperidines were disclosed in U.S. 3,318,900 as having analgesic activity.

Potent analgesic agents such as traditional opioids, e.g. morphine, carry with them significant side-effects. Clinically relevant side-effects include tolerance, physical dependence, respiratory depression, sedation and a decrease in gastrointestinal motility. For many patients, particularly those subjected to chronic opioid therapy, i.e. cancer patients, these side effects limit the dose of opioid that can be administered. Clinical data suggests that more than one-third of cancer patients have pain which is poorly controlled by present agents. Data obtained with nociceptin suggest the potential for advantages over opioids. When administered chronically to rodents, nociceptin, in contrast to morphine, showed no addiction liability. Additionally, chronic morphine treatment did not lead to a "cross-tolerance" to nociceptin, suggesting that these agents act via distinct pathways.

Unexpectedly, we have found that ORL-1 receptor agonists are useful in the treatment of cough.

When the optional double bond in the piperidinyl ring of formula I is present, one of X^1 and X^2 forms the bond with the 3-position carbon and the remaining X^1 or X^2 is not hydrogen.

When X¹ and X² in formula I form a spiro group as defined above, the wavy lines in the structures shown in the definition indicate the points of attachment to to the 4-position carbon of the piperidinyl ring, e.g., compounds of the following formulas are formed:

Certain compounds of formula I may exist in different stereoisomeric forms (e.g., enantiomers, diastereoisomers and atropisomers). The invention contemplates all such stereoisomers both in pure form and in mixture, including racemic mixtures.

Certain compounds used in the invention will be acidic in nature, e.g. those compounds which possess a carboxyl or phenolic hydroxyl group. These compounds may form pharmaceutically acceptable salts. Examples of such salts may include sodium, potassium, calcium, aluminum, gold and silver salts. Also contemplated are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

Certain basic compounds also form pharmaceutically acceptable salts, e.g., acid addition salts. For example, pyrido-nitrogen atoms may form salts with strong acid, while compounds having basic substituents such as amino groups also form salts with weaker acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base

10

solution such as dilute aqueous NaOH, potassium carbonate, ammonia and sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the acid and base salts are otherwise equivalent to their respective free base forms for purposes of the invention.

All such acid and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Compounds of formula I can be prepared by known methods from starting materials either known in the art or prepared by methods known in the art. Examples of general procedures and specific preparative examples are given below.

Typically, X^1, X^2 -substituted piperidines are alkylated with Z^1, Z^2, Z^3 -substituted halomethanes in the presence of excess bases such as K_2CO_3 and Et_3N , in solvents such as DMF, THF or CH₃CN, at room temperature or at elevated temperatures.

X1,X2-substituted piperidines are either commercially available or made by known procedures. For example, 4-hydroxy-4-phenyl-piperidine can be converted to a 4-tBoc-amino-4-phenylpiperidine according to the following reaction scheme, wherein Bn is benzyl, Ph is phenyl and tBoc is t-butoxycarbonyl:

Commercially available 4-phenyl-4-piperidinol is protected with a benzyl group and the resulting intermediate is then treated with Me₃SiCN. The resultant amide is hydrolyzed with aqueous HCl in CH₃OH to produce the 4-amino compound. The amino group is protected with *t*Boc and the N-

benzyl group is removed by hydrogenolysis to produce the desired 4-amino-piperidine derivative.

The 4-(protected)amino-piperidine then can be reacted with a Z^1,Z^2,Z^3 -halomethane and the protecting group removed. The amine (i.e., X^2 is -NH₂) can undergo various standard conversions to obtain amine derivatives. For example, the amine of formula I can be reacted with a R^{22} -carboxaldehyde in the presence of a mild reducing agent such as Na(OAc)₃BH or with a compound of the formula R^{22} -L, wherein L is a leaving group such as CI or Br, in the presence of a base such as Et₃N.

10

5

An alternative method for preparing compounds of formula I wherein X^1 is R^7 -aryl and X^2 is OH involves alkylating a 4-piperidone hydrochloride with a Z^1,Z^2,Z^3 -halomethane, then reacting the ketone with an appropriately substituted R^7 -phenylmagnesium bromide or with a compound of the formula X^1 -L 1 , wherein L 1 is Br or I, and n-butyl-lithium.

15

20

25

 X^1, X^2 -substituted compounds of formula I can be converted into other compounds of formula I by performing reactions well known in the art on the X^1 and/or X^2 substituents. For example, a carboxaldehydesubstituted piperidine (i.e., X^2 is -CHO) can be converted to a substituted piperidine wherein X^2 is R^{13} -O-CH₂-, as shown in the following procedure for a compound of formula I wherein X^1 is phenyl, Z^1 and Z^2 are each phenyl, and Z^1 , Z^2 and Z^3 are H:

A cyano-substituted piperidine (i.e., X^2 is -CN) can be converted to a substituted piperidine wherein X^2 is $R^{21}R^{22}N$ -CH₂- or X^2 is $R^{28}C(O)NH$ -CH₂-, as shown in the following procedure for a compound of formula I wherein X^1 is phenyl, R^{21} , R^1 , R^2 , R^3 and R^4 , and Z^3 are H, and L is a leaving group such as Cl or Br:

10

Compounds of formula I wherein X^1 is a benzofused nitrogencontaining heterocycle having an R^{11} substituent other than hydrogen are prepared by reacting the corresponding compounds wherein R^{11} is hydrogen with a compound of the formula $R^{11}L$ (R^{11} is not H, and L is as defined above).

Alternatively, X^1, X^2 -substituted piperidine starting materials can be converted into other X^1, X^2 -substituted piperidines by similar procedures before reacting with the Z^1, Z^2, Z^3 -substituted halomethane.

For compounds of formula I wherein R¹, R², R³ and R⁴ variously form alkylene bridges, commercially available N-protected 4-piperidones are treated with phenyl lithium and resulting intermediate is deprotected to produce the desired compounds, for example:

$$Pr$$
 Ph Ph Ph Ph

wherein Pr is a N-protecting group, Ph is phenyl and z is 1-2.

The Z^1 , Z^2 , Z^3 -halomethyl derivatives wherein Z^1 and Z^2 are R^7 -phenyl are either commercially available or can be prepared using the procedure shown in the following reaction scheme:

10

15

20

$$R^7$$
 R^7 R^7

Similar procedures, or others known in the art, can be used to prepare compounds wherein the Z substituents are other than phenyl.

<u>ASSAYS</u>

Nociceptin binding assay

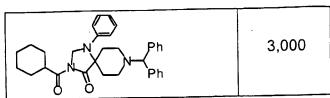

10 CHO cell membrane preparation expressing the ORL-1 receptor (2 mg) was incubated with varying concentrations of [125 I][Tyr14]nociceptin (3-500 pM) in a buffer containing 50 mM HEPES (pH7.4), 10 mM NaCl, 1mM MgCl₂, 2.5 mM CaCl₂, 1 mg/ml bovine serum albumin and 0.025% bacitracin. In a number of studies, assays were carried out in buffer 50 mM tris-HCl (pH 7.4), 1 mg/ml bovine serum alumbin and 0.025%

bacitracin. Samples were incubated for 1h at room temperature (22°C). Radiolabelled ligand bound to the membrane was harvested over GF/B filters presoaked in 0.1% polyethyleneimine using a Brandell cell harvester and washed five times with 5 ml cold distilled water.

Nonspecific binding was determined in parallel by similar assays performed in the presence of 1 μ M nociceptin. All assay points were performed in duplicates of total and non-specific binding.

Calculations of Ki were made using methods well known in the art. For compounds of this invention, Ki values were determined to be in the range of 0.6 to 3000 nM, with compounds having a Ki value less than 10 nM being preferred. Ki values for representative compounds of the invention are as follows:

EXAMPLE 12

Cough Studies

The effects of nociceptin agonist Compound A (0.3 - 10 mg/kg, p.o.) and Compound B (10 mg/kg, p.o.)

COMPOUND A

COMPOUND B

were evaluated in capsaicin-induced cough in the guinea pig according to the methods of Bolser et al. British Journal of Pharmacology (1995) 114, 735-738. This model is a widely used method to evaluate the activity of potential antitussive drugs. Overnight fasted male Hartley guinea pigs (350-450 q, Charles River, Bloomington, MA, USA) were placed in a 12" x 14" transparent chamber. The animals were exposed to aerosolized capsaicin (300 µM, for 4 min) produced by a jet nebulizer (Puritan Bennett, Lenexa, KS, USA) to elicit the cough reflex. Each guinea pig was exposed only once to capsaicin. The number of coughs were detected by a microphone placed in the chamber and verified by a trained observer. The signal from the microphone was relayed to a polygraph which provided a record of the number of coughs. Either vehicle (methylcellulose 1 ml/kg, p.o.) or Compound A or Compound B were given 2 hours before aerosolized capsaicin. The antitussive activity of baclofen (3 mg/kg, p.o.) was also tested as a positive control. The results are summarized in the bar graph in Fig. 1.

EXAMPLE 13

Respiratory Measurements

Studies were performed on male Hartley guinea pigs ranging in weight from 450 to 550 g. The animals were fasted overnight but given water and libitum. The guinea pigs were placed in a whole-body, head-out plethysmograph and a rubber collar was placed over the animal's head to provide an airtight seal between the guinea pig and the plethysmograph. Airflow was measured as a differential pressure across

10

a wire mesh screen which covered a 1-in hole in the wall of the plethysmograph. The airflow signal was integrated to a signal proportional to volume using a preamplifier circuit and a pulmonary function computer (Buxco Electronics, Sharon, CT., model XA). A head chamber was attached to the plethysmograph and air from a compressed gas source (21%O₂, balance N₂) was circulated through the head chamber for the duration of study. All respiratory measurements were made while the guinea pigs breathed this circulating air.

The volume signal from each animal was fed into a data acquisition/analysis system (Buxco Electronics, model XA) that calculated tidal volume and respiratory rate on a breath-by-breath basis. These signals were visually displayed on a monitor. Tidal volume and respiratory rate were recorded as an average value every minute.

The guinea pigs were allowed to equilibrate in the plethysmograph for 30 min. Baseline measurements were obtained at the end of this 30 min period. The guinea pigs were then removed from the plethysmograph and orally dosed with Compound A from Example 12 (10 mg/kg, p.o.), baclofen (3 mg/kg, p.o.) or a methylcellulose vehicle placebo (2 ml/kg, p.o.). Immediately after dosing, the guinea pigs were placed into the plethysmograph, the head chamber and circulating air were reconnected and respiratory variables were measured at 30, 60, 90 and 120 min post treatment. This study was performed under ACUC protocol #960103.

25 <u>Data Analysis</u>

30

35

The data for tidal volume (V_T), respiratory rate (f) and minute volume ($MV = V_T \times f$) were made for the baseline condition and at each time point after the drug or vehicle. The results are expressed as the mean \pm SEM. The results are shown in Figures 2A, 2B and 2C. Fig. 2A shows the change in Tidal Volume, Fig. 2B shows the change in Tidal Volume and Fig. 2C shows the change in frequency of breaths.

We have surprisingly discovered that nociceptin receptor ORL-1 agonists exhibit anti-tussive activity, making them useful for suppressing coughing in mammals. The ORL-1 agonists decrease the severity and

frequency of coughing. The coughing can be chronic, intractable or caused by a transient medical or environmental condition. Non-limiting examples of the causes for coughing are irritants, inflammatory diseases, influenza, asthma and upper respiratory diseases.

5

For mammals treated for coughing, the nociceptin receptor ORL-1 agonists may be administered along with one or more additional agents for treating cough, allergy or asthma symptoms selected from antihistamines, 5-lipoxygenase inhibitors, leukotriene inhibitors, H_3 inhibitors, B-adrenergic receptor agonists, xanthine derivatives, α -adrenergic receptor agonists, mast cell stabilizers, anti-tussives, expectorants, decongestants, NK_1 , NK_2 and NK_3 tachykinin receptor antagonists, and $GABA_B$ agonists. For example, the ORL-1 agonist can be administered in combination with an expectorant or an antihistamine, or with both an expectorant and an antihistamine. The combination preferably comprises 2 to 4 active agents.

Other compounds can readily be evaluated to determine activity at H₃ receptors by known methods, including the guinea pig brain membrane assay and the guinea pig neuronal ileum contraction assay, both of which are described in U.S. Patent 5,352,707. Another useful assay utilizes rat brain membranes and is described by West et al., "Identification of Two-H₃-Histamine Receptor Subtypes," *Molecular Pharmacology*, Vol. 38, pages 610-613 (1990).

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 70 percent active ingredient. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar, lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration.

For preparing suppositories, a low melting wax such as a mixture of fatty acid glycerides or cocoa butter is first melted, and the active ingredient is dispersed homogeneously therein as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool and thereby solidify.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection.

Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The actual dosage employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage for a particular situation is within the skill of the art. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day if desired.

The amount and frequency of administration of the compounds of the invention and the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated.

For treating cough, the amount of nociceptin receptor ORL-1 agonist in a unit dose is preferably from about 0.1 mg to 1000 mg, more preferably, from about 1 mg to 300 mg. A typical recommended dosage regimen is oral administration of from 1 mg to 2000 mg/day, preferably 1 to 1000 mg/day, in two to four divided doses. The compounds are non-toxic when administered within this dosage range.

When the nociceptin receptor ORL-1 agonist and one or more additional agents are administered together, they are preferably administered in a combined dosage form (e.g., a single tablet), although they can be administered separately. The additional agents are administered in amounts effective to provide relief from cough, allergy or

asthma symptoms, preferably from about 0.1 mg to 1000 mg, more preferably from about 1 mg to 300 mg per unit dose. A typical recommended dosage regimen of the additional agent is from 1 mg to 2000 mg/day, preferably 1 to 1000 mg/day, in two to four divided doses.

The following are examples of pharmaceutical dosage forms which contain a compound of the invention. The scope of the invention in its pharmaceutical composition aspect is not to be limited by the examples provided.
